ABSTRACT

Computer network becomes important nowadays. The rapid changes of technology make the consequences for the computer networking to improve the quality itself. In communication between the computers there are many things that must be considered to, such as the number of the connection that connected to one station, and how far the data will be transferred.

In designing the network model there are some weakness that usually done by the designer, in case of the connectivity. In some topologies that already exist there are no specific attentions in the sense of connectivity and the minimum distance that can be treasure in the network.

To discuss more about how to model the network with the specific connection, it will be shown in a graph model. In the real world case, there are a lot of things that can be represented as a graph, and one of it is the network. Each station in the network will be represent as a dot (vertex) and the connection will be represent with a line (edge).

In this thesis, we give an algorithm that used to design a network connection between computers, with a specific connection and also the maximum of the minimum distance that possible in the network. To explore this algorithm, there are some theorems used in case to help in specifying the model of the network. We also give an implementation of the algorithm, as the testing model of the algorithm itself.

Keywords: algorithm, drawing network, graph theory, k-connected graph, diameter.

ABSTRAK

Saat ini jaringan computer merupakan satu hal yang sangat penting. Perkembangan teknologi yang cepat menyebabkan perkembangan bagi kualitas jaringan computer. Pada komunikasi antar komputer ada berbagai hal yang harus dipertimbangkan, seperti jumlah koneksi yang terhubung pada satu stasiun dan seberapa jauh data-data akan dikirim.

Dalam merancang bentuk jaringan ada beberapa kekurangan yang biasanya dilakukan oleh perancang, khususnya dalam hal konektifitas (keterhubungan). Pada beberapa topologi yang sudah ada, tidak ada ketertarikan khusus pada hal konektifitas dan pada jarak minimal yang dapat ditelusuri pada jaringan.

Untuk mendiskusikan lebih lanjut tentang bagaimana merancang suatu jaringan dengan koneksi tertentu, akan dibahas dengan menggunakan *graph*. Dalam kehidupan nyata, ada banyak hal yang dapat direpresentasikan sebagai *graph*, dan salah satunya adalah bentuk jaringan. Setiap stasiun pada jaringan akan direpresentasikan sebagai sebuah titik dan koneksinya akan direpresentasikan sebagai sebuah garis.

Pada tugas akhir ini, dibuat perancangan sebuah algoritma yang digunakan untuk merancang sebuah jaringan yang menghubungkan komputer-komputer, dengan jumlah koneksi tertentu dan juga nilai maksimal dari jarak minimal yang mungkin dari suatu jaringan. Untuk memahami algoritma ini, ada beberapa teori yang digunakan terutama dalam hal menspesifikasikan bentuk jaringan

Kata kunci: *algoritma, menggambar jaringan, teori graph, graph k-connected, diameter.*

ACKNOWLEDGEMENT

Most of all I thank the Almighty Jesus Christ, because of His blesses and guidance I can have been blessed to finished my thesis. A big thank you also for my lovely parents who already support me and help me during my study, and also thank you for their uncountable love that given to me, also for my brothers Noldy and I Fung and my sisters Sherly, Lanny and Noufa, who always support me and push me to finish my thesis.

I want to give special thanks to my first supervisor Dr. Benny Pinontoan, M.Sc. that already give much knowledge, suggestion and also support during my research and writing. Thank you for my second supervisor, Rubby Padang, S.Kom that already helps me to understand about the network.

Special thanks also for the other examiners, Ir. Armien Z.R Langi M.Sc., Ph.D and Dr. Ir. Rajesri Govindaraju, M.Sc. as the examiners of this thesis. Thank you for all advices and comments in improving this thesis.

I also want to thank Dr. Johanis J. Montolalu, Pr, the rector of De La Salle University of Manado, Ir. Noldi Watuna MM, Dean of College of Engineering, thank you for the support and also many advice during the writing process, and also I want to thank Ir. Simon Patabang, MT., Head of Department of Informatics Engineering Department, and to all the staff of De La Salle University of Manado, especially the staff in Informatics Engineering Department, thanks for their assistance and encouragement during the writing.

I also want to give a big appreciate for my friend Harold and Bobby, who already give many contribution in my programs, and also to all my friend, especially those who works together with me during several years in De La Salle University, that I can not mention one by one, thank you for all the support for me.

A very special thanks for my friend Wenny, thank your for your support and thank you for being my lovely friend. I also thank all my friends in my group, Lanny, Lisa, Lia, Echi and Ui, also for those three from Computer Science

faculty, Yeyen, Ingrid and Yuni. Thanks for all wonderful time that we have together.

Last but not least, I want to thank all the people who already help me during my research and writing the thesis, for those who help me to find references, and also for those who help me in writing manners. May God always be with you!

*There will always a way for those who believe in GOD
Because in GOD everything is possible.....*
